OstlerTech
SyncPass

Security checklist

If your phone got stolen, would your accounts be safe? 10 checks

Tick each one. All from public sources, listed at the bottom.

Check			In SyncPass
☐	1	**A different password for every account** One breach stays one breach; let a password manager do the remembering. [CISA]	Security score shows reused passwords
☐	2	**At least 15 characters** Length beats complicated rules; a few words in a row works. [NIST]	Password generator
☐	3	**Two-step verification on email and banking** A stolen password alone won't get in. [CISA]	2FA codes **(Premium)**
☐	4	**An app or a passkey instead of SMS, where you can** NIST lists SMS as a "restricted" method. [NIST]	Passkeys; 2FA codes **(Premium)**
☐	5	**Keep recovery codes somewhere safe** They're your way back in if you lose the phone.	Secure note
☐	6	**Recovery email and phone up to date** Pick an address you use often, other than your sign-in email; phone changes can take up to 7 days. [Google]	
☐	7	**Screen lock and remote find/lock/erase turned on, before the phone goes missing** [Google]	Vault locks when you leave the app
☐	8	**Automatic updates** Security fixes ship in updates. [CISA]	
☐	9	**Is your password in a breach?** Change leaked ones right away; NIST asks for new passwords to be checked against breach lists. [NIST]	Breach check **(Premium)**; only the first 5 characters of a hash leave the phone
☐	10	**Never type a password into a page you reached from a link** Type the address yourself or open the app; report suspicious messages. [CISA]	Autofill only suggests on the matching site
